

# Quat Test Strips

How to test sanitiser solution (buckets / sinks)

**WHEN:** Daily

## KFC Sanitising Test Strips

### Quat Test Strips

These should be used daily to check that the sanitiser solution is being dispensed at the correct dilution.

#### Step 1

- Take a piece of test strip.

#### Step 2

- Dip the test strip into the solution to be tested, which includes sanitiser sink of the 3-compartment sink and the buckets with sanitiser solution, avoiding the foam, for 1-2 seconds.
- A new test strip should be used for each solution which is tested.  
**DO NOT use the same test strip for all solutions.**

#### Step 3

- Check the colour of the test strip against the colour chart on the tube and make sure it is **250 ppm** which is the correct dosage.
- If the solution is less or more than **250 ppm** re-check before calling service to check the equipment.

- ALWAYS** check the concentration of sanitizer solution in the buckets and 3rd sink when you prepare the solution and before rush hour.
